

**Good quality tempered
laminated glass supply with
the best price**

Laminated tempered glass is using two or more pieces of tempered glass panels sandwich with interlayer material like PVB or SGP or EVA material, enduring high pressure and high temperature, thus making the joint of glass permanently together. When one or more panels in the laminated glass are broken due to extreme impact, the broken pieces will still glue together with the PVB or SGP interlayers.

Preventing glass pieces from spreading and ensure safety.
