

**2 pieces of tempered glass  
can be processed into the  
insulated tempered glass to  
improve its excellent  
performance**

## **What is insulating glass□**

Insulated glass, also known as insulated tempered glass, is a type of glass that consists of two or more panes separated by a vacuum or gas-filled space. It has superior thermal insulation compared to standard single-pane windows, which helps to keep energy costs low.

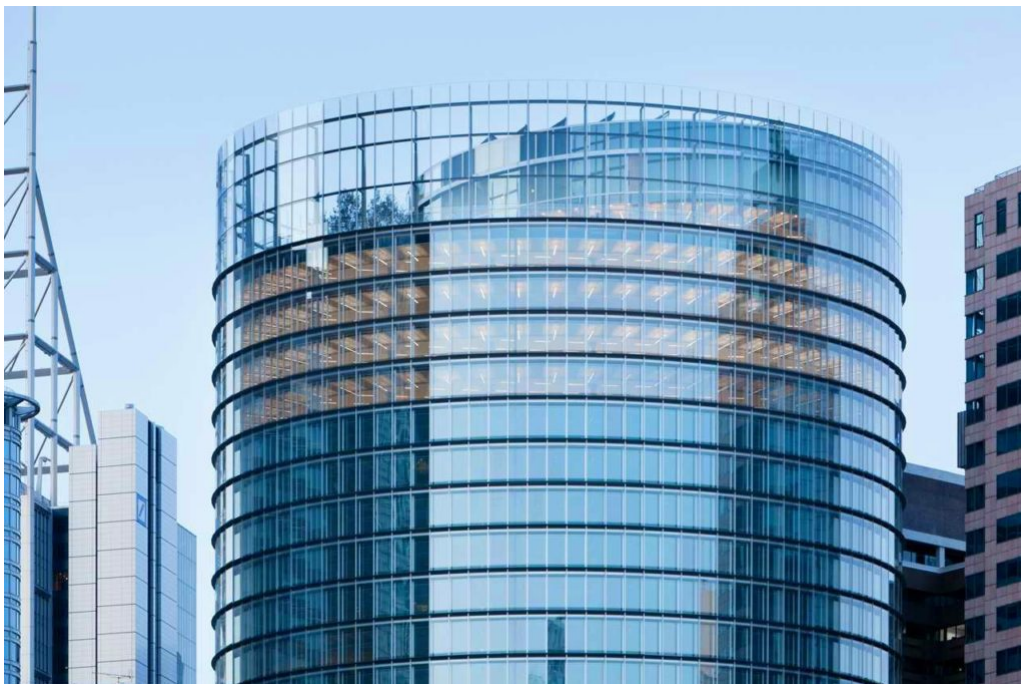

## insulated glass VS tempered glass

Compared with insulating glass, tempered glass is much lower in sound insulation and heat insulation performance than the latter. So we suggest that you use tempered glass as raw material to make insulating glass. so that the performance of both of them can be superimposed to become high-performance insulated tempered glass. The combination of these features makes insulated tempered glass an ideal choice for use in commercial buildings, residential homes, and other structures where energy efficiency and noise reduction are desired.
